Final Project

For my final project, I used WebCT to set up one of the classes that I currently teach in the traditional classroom setting so that it could be used either in a blended learning environment or a distance education setting. While the course could be changed and set up so that students were required to go through each of the units in particular order, it is currently set up so that the students could go through the units in whichever order they choose. I understand that I will need to continue to update this course in WebCT as I continue to teach the course.

Each unit has its own folder on the course's homepage. Within the folder one can find a variety of files including an information sheet, slideshow presentation, note taking guides, and worksheets.

Several of the units also have discussion topics that go along with the unit. Some of the discussion topics are set up to be used in a thread format, while others are set up to be a journal format. In the thread format, the students names will remain anonymous to the other students which will hopefully encourage students to be more open with their answers. The journal topics will only be available for the student and teacher to access.

Assessments have also been set up in which the student would be able to take their test online.
